# TRACKMAN STUDIO AT YORK GC

---

Here at York Golf Club we are proud to use the most advanced coaching, fitting and simulation software available. Trackman4 is used by the best players, coaches and club manufacturers around the world.

# TRACKMAN GOLF

## LEARN MORE ABOUT THE FUTURE OF INSTRUCTION

Trackman's Dual Radar Technology enables even more data to be captured. Due to its focused, high-resolution radar beam, the Trackman 4 launch monitor provides the user with the greatest detail and accuracy of the club and ball at the moment of impact.

### WE GET ALL THE DATA

Trackman uses its dual radar system to measure 26 different parameters of both ball and club data, for every shot that is hit. This enables us as coaches and fitters to ensure that you receive the best lesson and fitting experience possible.

- Smash Factor
- Spin Rate
- Launch Angle
- Carry
- Ball Speed
- Club Speed
- Dynamic Loft
- Attack Angle
- Club Path
- Face Angle

### HOW ACCURATE? EXTREMELY:

All major companies with no exceptions, use and trust Trackman for two reasons; the reliability of the data and the precision of it. The radar is able to accurately measure both indoor and out, the landing position of a shot with an accuracy of less than 1 foot from 100 yards. Each shot is displayed using the shot's 3D trajectory as well as the ability to highlight any of the 26 different impact and ball flight parameters within 1 second of being hit.

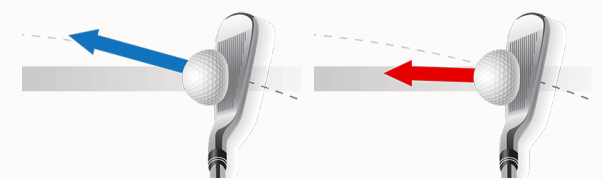

*Ball Speed: the speed of the golf ball's centre of gravity immediately after separation from the club face.*

*Spin Rate: the rate of rotation of the golf ball about the imaginary line the ball rotates around*

*Attack Angle: the up/down movement of the club head's geometric centre at the time of maximum compression*

*Launch Angle: the vertical angle the ball takes off at relative to the horizontal*

*Launch Direction: the horizontal angle the ball takes off at relative to the target line*

*Face Angle: the direction of the face at the center point of contact between ball and club*
